method, the described method may also be useful. In accordance with the worked out e-foresight methodology, the performance of survey studies is expected through an original developed method which uses modern IT tools for obtaining the adopted aims: virtual organisation, internet platform and neuron networks. Attention must be paid also to an important practical feature of the proposed approach which enables the application of the worked out methodology with regard to each detailed technology of manufacturing a specific final product, as well as to different sizes of technology groups if their division is possible in terms of a clearly defined objectively verified criterion. As part of a broad scope of the currently realised individual studies, the working out of many groups of surfacing technologies was anticipated, using the mentioned newly-developed tools, which will certainly be the subject of further publications in which the methods described in this work will be applied.
